

Silverbell West
Water System 10-162

2004 Annual Water Quality Report

WATER QUALITY MANAGEMENT DIVISION

THIS WATER QUALITY ANNUAL REPORT PROVIDES INFORMATION ON YOUR SPECIFIC DRINKING WATER SYSTEM.

City of Tucson
Tucson Water
P.O.Box 27210
Tucson, AZ 85726-7210

Whom do I contact for more information?

For more information on this Tucson Water report contact Tom Jefferson or Mohsen Belyani with the Water Quality Management Division at 791-5252. Or, e-mail your questions to tom.jefferson@tucsonaz.gov or mohsen.belyani@tucsonaz.gov.

Telephone Numbers:

Drinking Water Hotline: 1-800-426-4791

USEPA Website: www.epa.gov/safewater/

Were there any contaminants detected in my drinking water?

Tucson Water regularly samples the drinking water that is delivered to you. Much of this testing is required by drinking water regulations. In addition to this required monitoring, we perform a great deal of discretionary monitoring in order to provide both Tucson Water staff and customers with additional information.

The Detected Contaminants Table below lists all contaminants that were detected in either the required or the discretionary drinking water monitoring. Two inorganic contaminants of special interest are arsenic and fluoride, which are naturally occurring. For more information, please see the table and the specific explanations, which follow the table.

In most cases, the minimum detectable level of a contaminant is well below the USEPA regulatory limit for that contaminant. To compare the detected amount with the amount allowed by the USEPA, refer to the Maximum Contaminant Level (MCL) column in the table. The vast majority of regulated contaminants were not detected in drinking water delivered by Tucson Water. The non-detected results were not included in the table. For a complete list of all USEPA regulated contaminants contact the USEPA at 1-800-426-4791 or visit the USEPA website at www.epa.gov/safewater/mcl.html#mcls.

Detected Contaminants Table

CONTAMINANT	ANALYSIS DATE	MAXIMUM RESULT	RANGE	MCL	MCLG	MAJOR SOURCES
Inorganics						
Arsenic, Total	2004	18 ppb	18 - 18 ppb	50 ppb	None	Natural deposits
Barium	2001	0.08 ppm	0.074 - 0.08 ppm	2 ppm	2 ppm	Natural deposits
Chromium	2001	< 20 ppb	6.9 - < 20 ppb	100 ppb	100 ppb	Natural deposits
Fluoride	2004	2 ppm	1.1 - 2 ppm	4 ppm	4 ppm	Natural deposits
Nitrate (as N)	2004	0.99 ppm	0.99 - 0.99 ppm	10 ppm	10 ppm	Natural deposits; septic tanks; agriculture;sewage
Radiochemical						
Adjusted Gross Alpha	2001	0.3 pCi/L	0.3 - 0.3 pCi/L	15 pCi/L	0 pCi/L	Natural deposits
Radium 226	2003	0.4 pCi/L	0.4 - 0.4 pCi/L	5 pCi/L (combined)	None	Natural deposits
Radium 228	2003	0.4 pCi/L	0.4 - 0.4 pCi/L	5 pCi/L (combined)	None	Natural deposits
Radon Activity	2000	642 pCi/L	351 - 642 pCi/L	No MCL	None	Natural deposits
Uranium	2001	5.6 ppb	5.6 - 5.6 ppb	30 ppb	None	Natural deposits

CONTAMINANT	ANALYSIS DATE	NO. OF SAMPLES ABOVE THE ACTION LEVEL	90 TH PERCENTILE VALUE	ACTION LEVEL	MCLG	MAJOR SOURCES
Lead and Copper in Standing Water Samples						
Lead	2004	none	2.5 ppb	15 ppb	0	Corrosion of household plumbing systems
Copper	2004	none	0.025 ppm	1.3 ppm	1.3 ppm	Corrosion of household plumbing systems

Drinking Water Terms and Definitions

Action level. The concentration of a contaminant that if exceeded, triggers a treatment or other requirement which a water system must follow.

Maximum Contaminant Level (MCL). The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology. If a contaminant is believed to cause health concerns in humans, then the MCL is set as close as practical to zero and at an acceptable level of risk. Generally, the maximum acceptable risk of cancer is 1 in 10,000 with 70 years of exposure.

Maximum Contaminant Level Goal (MCLG). The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Parts Per Billion (ppb). Some constituents in water are measured in very small units. Organic compounds such as trihalomethanes are monitored by Tucson Water in terms of parts per billion (or micrograms per liter). To help you visualize how very small this unit is, we offer the following illustrations. One part per billion equals: One second of time in 31.7 years or the first 16 inches of a trip to the moon.

Parts Per Million (ppm). Many dissolved minerals such as sodium and calcium are monitored by Tucson Water in terms of parts per million (or milligrams per liter). To help you visualize how very small this unit is, we offer the following illustrations. One part per million equals: 2 ounces of water in a typical 15,000 gallon backyard swimming pool or one second of time in 11.6 days.

Picocurie Per Liter (pCi/l). The quantity of radioactive material in one liter which produces 2.22 nuclear disintegrations per minute.

Detail Information on Detected Contaminants

Arsenic In 2001 USEPA finalized a reduction in the arsenic drinking water standard from 50 ppb to 10 ppb. All water utilities must meet this new standard beginning January 2006. While your drinking water meets EPA's standard for arsenic, it does contain low levels of arsenic. USEPA's new standard balances the current understanding of arsenic's possible health effects against the costs of removing arsenic from drinking water. USEPA continues to research the health effect of low levels of arsenic which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damages and circulatory problems. Some people who drink water containing arsenic in excess of the MCL over many years could experience skin damage or problems with their circulatory system, and may have an increased risk of getting cancer. Arsenic concentration for this water system during 2004 was 18 ppb. In order to provide your neighborhood with drinking water which will meet the new 10 ppb drinking water standard for arsenic by 2006, Tucson Water has drilled a new groundwater well that is anticipated to begin operating June 2005. The new well has been screened to produce water from a selected depth beneath the surface, from an area of the aquifer which meets all the drinking water standards. This is the most effective solution to meet the new arsenic standard and is expected to have a high likelihood of success but will be monitored closely until all water quality parameters stabilized and are shown to be well within the standards. The initial arsenic result in this new well was 5.4 ppb.

Barium occurs naturally at very low concentrations in our groundwater.

Chromium is a trace metal and an essential nutrient; however, it can be toxic at high concentrations greater than the MCL especially in the hexavalent form, which is more common when the source is industrial waste.

Fluoride During 2004, we collected monthly samples from the Silverbell system. The results ranged from 1.1 ppm to 2.0 ppm, with an average of 1.38 ppm. Tucson Water is providing this special notice to parents of children under the age of nine who live in the Silverbell West area. At levels around 1.0 ppm, fluoride can help to form healthy teeth and bones and prevent cavities. However, children whose permanent teeth are still developing and whose drinking water contains more than 2.0 ppm of fluoride may develop a cosmetic discoloration of their permanent teeth (dental fluorosis.) At the current level, there is some concern that additional exposure to fluoride from swallowing fluoridated toothpaste or by taking fluoride supplements may present a risk of fluorosis in children less than nine years old. Public health authorities advise against fluoride supplements if your water contains more than 1.0 ppm of fluoride. You may want to contact your dentist for more specific recommendations for reducing the risk of cosmetic discoloration while maintaining protection against dental cavities. Tucson Water will be collecting monthly samples for fluoride and will be notifying you if the average fluoride level increases above 2 ppm. If you would like more information on fluoride, please contact us at the number given at the end of this report. The initial fluoride result in the new well was 0.41 ppm.

Nitrate is a form of nitrogen and an important plant nutrient. Nitrate in drinking water at levels above 10 ppm is a health risk for infants of less than six months of age. High nitrate levels in drinking water can cause blue baby syndrome. Tucson Water performs extra monitoring on wells high in nitrate for extra assurance that action can be taken when approaching the MCL. The initial nitrate result in the new well was 8.1 ppm.

Adjusted Gross Alpha is a measure of radioactivity due to naturally occurring minerals in groundwater. The MCL for gross alpha radioactivity is set at 15 picocuries per liter (pCi/L). This excludes the radioactivity contributed by either radon or uranium.

Radium 226 and 228 are two of the most common radium isotopes. Radium is a naturally occurring radionuclide, formed by the decay of uranium or thorium in the environment. It occurs at low concentrations in virtually all rock, soil, water, plants, and animals. During 2003 an extensive sampling of these two isotopes was performed at our wells. For this system, the highest concentration found for radium 226 was 0.4 pCi/L and for radium 228 was also 0.4 pCi/L (the MCL is 5 pCi/l for both isotopes combined).

Radon is a naturally occurring radioactive gas that may cause cancer, and may be found in drinking water and indoor air. While ingesting radon in drinking water has a small risk, inhaling radon is a primary health concern, particularly for smokers or ex-smokers. Radon diffusing up from the soil into homes and buildings is usually the main source of radon in indoor air. Only about 1-2 percent of radon in indoor air comes from drinking water. If you are concerned about radon in your home, you should test your house and install controls if you find a level of 4 pCi/L or higher in your indoor air. For more information, call USEPA's Radon Hotline (800-SOS-RADON) or visit the web site <http://www.epa.gov/iaq/radon/>. The USEPA does not currently have a final regulation for radon in drinking water. Extra radon monitoring was performed on Tucson Water wells in two quarters in 2000. Test results indicate that when compared with other communities across the country, Tucson has fairly typical concentrations for radon in the water supply.

Uranium is a heavy metal, which is highly toxic and radioactive. The USEPA has set a new standard of 30 ppb for uranium, which water systems must have met since December 2003.

Lead and Copper are naturally occurring metals, which are generally found at very low levels in some waters. However, these levels can increase when water contacts plumbing materials containing lead pipe, lead soldered copper tubing, or brass. Infants and young children are typically more vulnerable to lead in drinking water than the general population. While Tucson Water is well within standards, concerned customers can take an extra precaution to protect children from lead leached from new brass faucets by running the water for a few seconds and using the water for something other than drinking. This is especially important if the water has been sitting in the pipes for a few hours or more. These same precautions also help to give you a better-tasting water.

During 2004, Tucson Water ensured that your drinking water met all drinking water standards

This Annual Water Quality Report provides information on your drinking water. The United States Environmental Agency (USEPA) requires that all drinking water suppliers provide a water quality report to their customers on an annual basis. This report also serves as a reference with important information on the quality of water and with contacts and phone numbers you may need from time to time.

Silverbell West

System is a small water system serving approximately 85 homes. The system is served by well W-001A.

Why are there contaminants in my drinking water?

All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. Tucson's groundwater contains dissolved minerals and organic compounds, which have been leached from rocks, sediments, and plant minerals through which the water travels. One would expect to find beneficial minerals such as calcium and magnesium, harmless minerals such as chloride, bicarbonate, and sulfate, and metals such as iron, copper, arsenic, and lead, which may be either beneficial or harmless at low concentrations, but harmful at high concentrations. In addition to these naturally occurring contaminants, groundwater may contain contaminants resulting from human, industrial, or domestic activities. For this reason, water utilities must currently monitor for approximately 90 regulated and 12 unregulated contaminants.

The following language is required by the USEPA to appear in this report, some of which may not be applicable to deep groundwater wells, the source of this water supply:

Contaminants that may be present in a source water can include:

- *Microbial contaminants, such as viruses and bacteria, which may come from sewage, agricultural livestock, and wildlife.*

- *Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.*
- *Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.*
- *Organic chemical contaminants, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.*
- *Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.*

In order to ensure that tap water is safe to drink, USEPA regulations limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water that must provide the same protection for public health. Bottled water may come from either a surface water source or groundwater source, and may be treated minimally or extensively. For information on the quality of your bottled water, contact the water bottling company.

Do I need to take special precautions?

While the Safe Drinking Water Act regulations are intended to protect consumers throughout their lifetime, some people may be more vulnerable to infections from drinking water than the general population. These "at-risk" populations include: immuno-compromised persons such as persons with cancer undergoing chemotherapy, people who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, and in some cases, elderly people and infants. These people should seek advice about drinking water from their health care providers. USEPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbial contaminants are available from the USEPA's Safe Drinking Water hotline.

How is my drinking water treated?

The groundwater delivered by Tucson Water meets all drinking water standards without treatment. However, approximately 0.8 parts per million (ppm) of chlorine is added to the drinking water supply to provide assurance that water delivered to customers will remain free of microbiological contamination. This also ensures that the water meets microbiological drinking water standards from the time it is pumped from the ground until it reaches the customer's tap.

Source Water Assessment Program (SWAP):

Arizona Department of Environmental Quality has completed a source water assessment of this system, which evaluates the risk of contamination from human activities. The water sources for this system are categorized as "low risk of contamination from human activities".
